CL07 tips (bit.ly/sam-wi22)

Part 1: See Lecture 13 on cogs18.github.io if you're having trouble.

Part 2: Your functions can be simple, as long as they take in an instance of your class as an argument and call one of its methods.

After importing a .py file once, importing it again won't reload it. You'll have to restart your kernel if you made edits to the .py file and need to reload it.

Part 3: In this part, you'll need to create another .py file (which has similar code to the previous cell). Then, you'll need to run the file from the terminal.
