Exam Recap

CL05: Loops Walkthrough

CL05 tips (bit.ly/sam-wi22)

Infinite Loops: What is the value of counter if you just put break as the last line of the while loop? For part 2, you can't use break. Instead, you'll need to change True to something else.

Specific looping task: You should start by defining three variables: one list that holds both integers and strings, one empty list for integers, and one empty list for strings.

Debugging Challenge: Only the body of the for loop needs fixing.

Nested Loop Challenge: Start by writing a single loop to print 1-7 on one line. Then, edit it to print 1-6, or 1-5. What parts of the code needed to change? Those parts are what you need the second (outer) loop for.
