CL06 tips (bit.ly/sam-wi22)

Reverse: If you're having trouble, start by printing the letters in the string in reverse order.

Palindrome: You don't need a loop for this function.

TritonCourse: Remember that the first argument to `__init__()` is always `self`.

print_info: You'll need to start by copy-pasting the entire `TritonCourse` class definition, then add your method to it.

Objects challenge: I don't recommend writing the entire class in one go; start by defining `__init__()`, testing the code to make sure it works, and then adding methods.

add_student: There's a typo: the dictionary key 'A1' is listed twice, but the keys should be 'PID', 'A1', 'A2', and 'E1'.
